

DATA ANALYSIS

Research Methods

Fall 2015

DATA ANALYSIS

- What type of data do you have?
 - Quantitative
 - Surveys
 - Database information
 - Organizational data
 - Qualitative
 - Interview
 - Notes
 - Observations
 - Policies, organizational data
- Data determines type of analysis
 - Quantitative Analysis
 - Qualitative Analysis

QUANTITATIVE ANALYSIS

- Can turn data into numbers if desired
 - Can count instances of behaviors
 - Can turn basic info into numbers
 - Male/Female, Occupation, Hometown
 - I.e. Female=1, Police officer=4, NY =2
 - Can develop numbers for code categories
 - What are the biggest issues at John Jay?
 - Tuition is too high X
 - Cafeteria food is not good
 - Books costs too much X
 - Advisors are never available
 - Not enough financial aid X
 - Could make “Financial Concerns” = “1”
 - If develop numerical code categories will need to create a **cobobook** to keep track

QUANTITATIVE ANALYSIS

TABLE 14-3 Nonacademic Concerns Coded as "Administrative" or "Facilities"

| | Academic | Administrative | Facilities |
|--|----------|----------------|------------|
| Tuition is too high | | X | |
| Not enough parking spaces | | | X |
| Faculty don't know what they are doing | X | | |
| Advisors are never available | X | | |
| Not enough classes offered | X | | |
| Cockroaches in the dorms | | | X |
| Too many requirements | X | | |
| Cafeteria food is infected | | | X |
| Books cost too much | X | | |
| Not enough financial aid | | X | |

FROM DATA TO INSIGHT: STATISTICS

- We've done our research and gathered data.

Now what?

- We can use **statistics**, *which are tools for organizing, presenting, analyzing, and interpreting data.*

The Need for Statistical Reasoning

- A first glance at our observations might give a misleading picture.
- Value of statistics:
 1. To present a more accurate picture of our data (e.g. the scatterplot) than we could see otherwise.
 2. To help us reach valid conclusions from our data; statistics are a crucial critical thinking tool.

QUANTITATIVE ANALYSIS

- Numerical data often analyzed using statistic software programs
 - SPSS, SAS, R
- Statistical Analyses
 - Univariate Analysis: analysis of a single variable
 - Example: mean, median, mode, frequencies, distributions
 - Frequency distribution: number of times attributes of a variable were observed in the sample
 - I.e. 51% of the sample is female
 - Gives a count or percentage to describe the sample

Measures of central tendency

Are you looking for just ONE NUMBER to describe a population?

Options:

Mode

- the most common level/number/score

Mean (arithmetic “average”)

- the sum of the scores, divided by the number of scores

Median

(middle person's score, or 50th percentile)

- the number/level that half of people scored above and half of them below

Measures of central tendency

Descriptive Statistics

| | N | Minimum | Maximum | Mean | Std. Deviation |
|--------------------|----|---------|---------|---------|----------------|
| height | 27 | 58.00 | 75.00 | 66.8148 | 4.37684 |
| shoe | 29 | 5.50 | 14.00 | 9.0172 | 2.30869 |
| age | 28 | 18.00 | 27.00 | 20.1786 | 2.45030 |
| Valid N (listwise) | 26 | | | | |

Measures of variation:

how spread out are the scores?

- **Range:** the difference between the highest and lowest scores in a distribution
- **Standard deviation:** a calculation of the average distance of scores from the mean

QUANTITATIVE ANALYSIS

◎ Univariate Analyses

- Describes the sample
- Example: What is the average income of the sample?

◎ Bivariate Analyses

- Focuses on relationships between variables
- Seeks to find relationships between variables
- Often looking for cause/effect relationships of independent and dependent variables
- How does education level relate to average income?

◎ Multivariate Analyses

- Looks at multiple relationships between variables
- Example: What are the effects of *age*, *gender*, and *income* on religiosity?

QUALITATIVE ANALYSIS

- ◉ In a qualitative analysis, you do not convert data into numbers
- ◉ Can use coding methods to look for patterns and relationships: **Grounded Theory Methods (GTM)**
- ◉ Can write **Memos** to summarize data into coherent ideas; often used with GTM
- ◉ Can use **Conversational Analysis** to deeply analyze details of a conversation including pauses, silences, and utterances
- ◉ Can use **Concept Mapping**, a graphical display of concepts, codes, and their relations to illuminate patterns and theories

QUALITATIVE ANALYSIS

- Qualitative Analysis
 - Examination and interpretation of non-numerical observations and data
 - Main goal of qualitative analysis = *Discovering Patterns*
- Grounded Theory Methods
 - Begins with observations and seeks to discover patterns
 - Uses a *constant comparative method*: always comparing cases
 - Attempting to find patterns in observations
 - Use patterns to describe larger phenomenon
- Thematic Analysis
 - A way of looking for patterns and themes in qualitative data

CODING

- What is a code?
 - Word or phrase that describes a passage of text
 - Classifies and categorizes your data
 - A “code” tries to capture the main idea of a statement or phrase uttered by your participant
- First: Line-by-Line Coding
 - Choose word or phrase from *each line* that best captures the Main Idea
- Open Coding
 - Use 2-3 line-by-line codes to come up with a code that captures the main idea of the sentence, phrase, utterance or passage

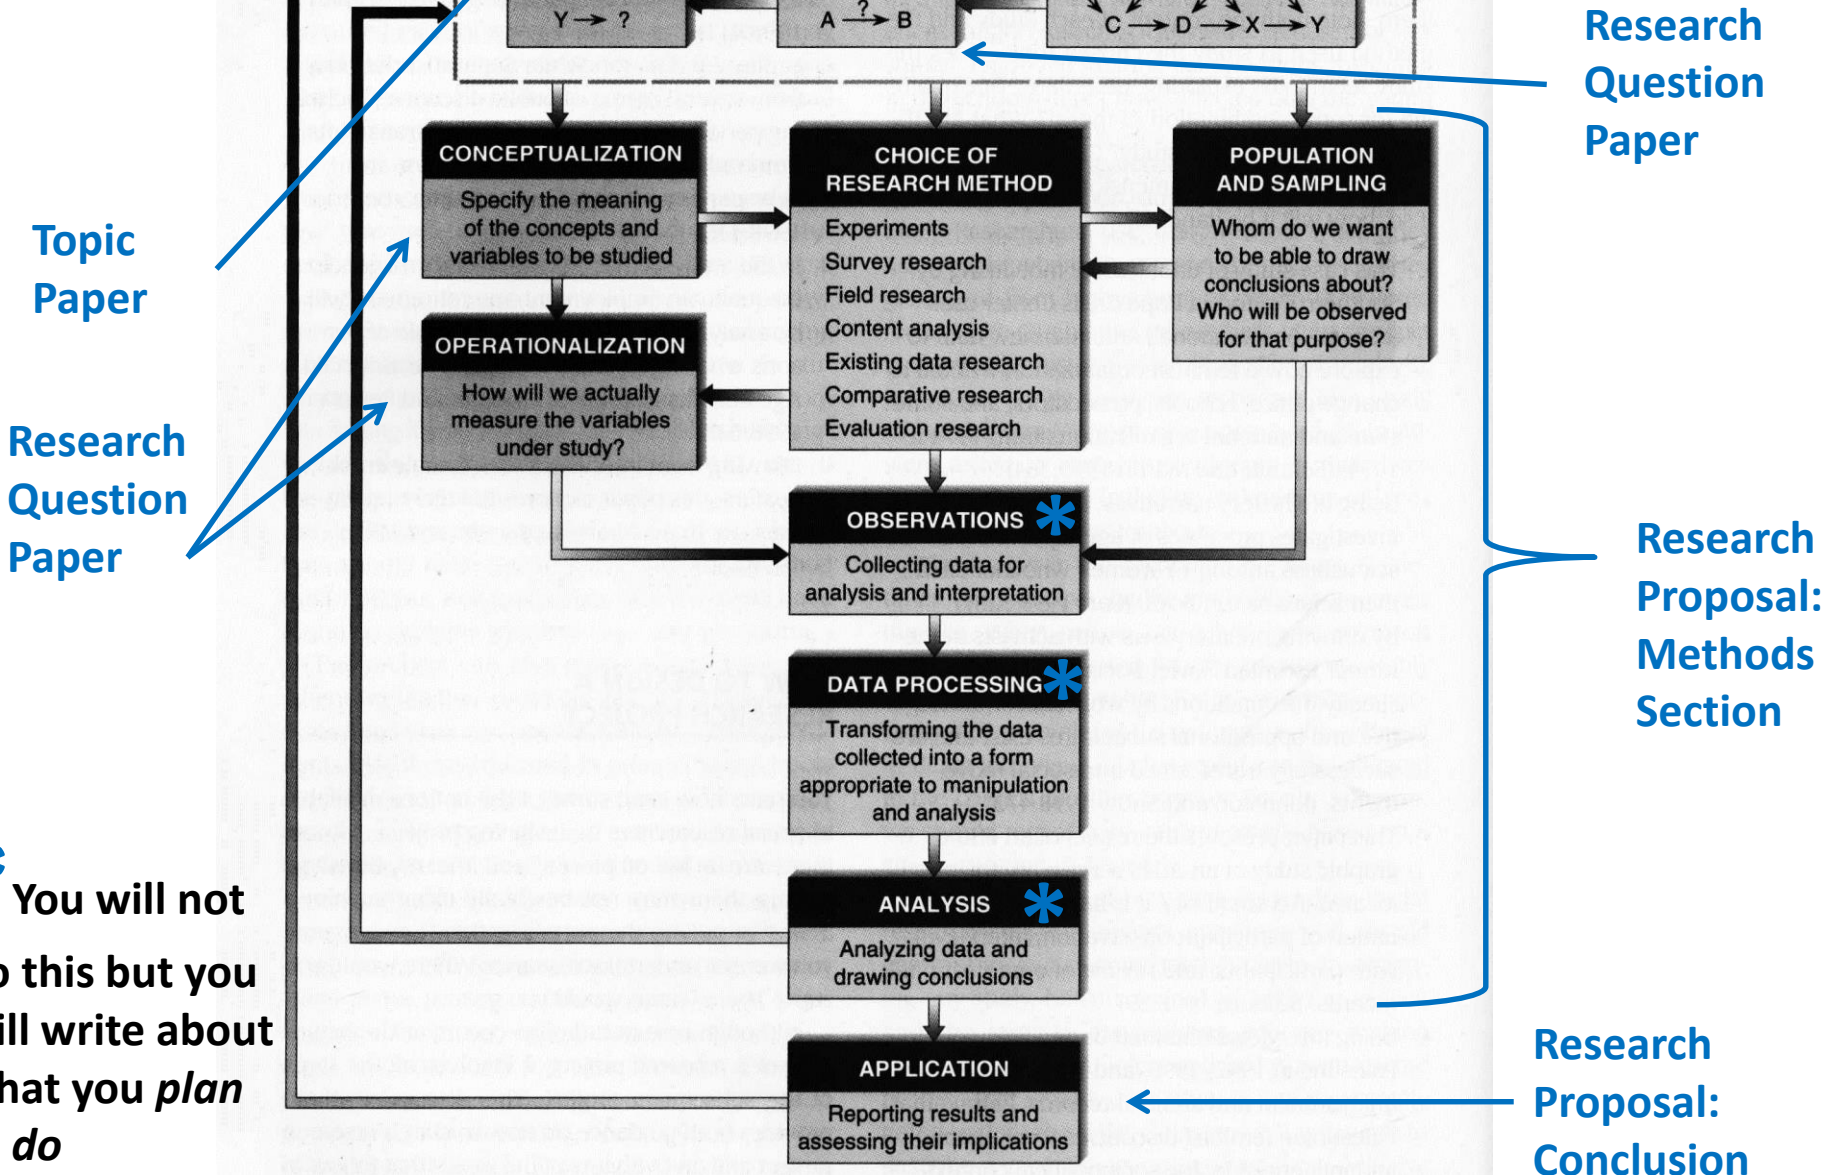

CODING

- Coding for Patterns
 - Open coding has reveals topics that are covered in your interview
 - Looking at open codes across a couple interviews you may see common ideas or topics
 - Patterns may begin to emerge
- Axial Coding
 - Once you have several interviews and you begin to see patterns in the open codes **you can begin to identify more general, unifying concepts**
 - Use code to create categories
 - CODES [politics, funding, lack of support, administration, Zero tolerance] =
 - CATEGORY [Problems with Education system]
- Other methods take transcripts and code in new and different ways

DESIGNING A RESEARCH PROPOSAL

- ◉ Topic and Question
- ◉ Hypothesis
- ◉ Conceptualization
 - Specify the variables to be studied
- ◉ Operationalization
 - How exactly will you measure the variables?
- ◉ Choice of Research Method
 - Quantitative or Qualitative
- ◉ Population and Sampling
 - Who?
- ◉ Measurement & *Data Collection**
 - *How?*
- ◉ *Data Analysis**
 - Type of analysis
 - Focus of analysis (indicated by operationalization of variables)

Lit Review

* You will not do this but you will write about what you *plan to do*
